QA Auto Bug Reporter Pro

User Operations & Workflow Manual

---

1. Welcome & Introduction

Welcome to **QA Auto Bug Reporter Pro**! This user manual provides step-by-step instructions on how to effortlessly report software defects, upload screenshots to the cloud, translate informal notes into 100% professional corporate English, and maintain a master Excel bug report spreadsheet.

2. Quick Launch (1-Click Start)

Starting the application requires only a single click without terminal commands:

1. Open the project root folder: d:\make test excel test case auto
2. Double-click the file named **run.bat**.
3. The black server terminal will initialize, and your default web browser will automatically open the dashboard at:

   → **URL:** http://127.0.0.1:5000

3. Core Defect Logging Workflow

Step	Action	Best Practice & Guidelines
Step 1	**Capture Screenshot**	Take a screenshot using Windows Snipping Tool (Win + Shift + S). Click and drag to capture the buggy screen, URL bar, or error popup.
Step 2	**Direct Paste (Ctrl + V)**	Switch to your browser and press Ctrl + V. The image appears instantly in the gallery. You can paste multiple screenshots sequentially or drag & drop files.
Step 3	**Describe in Banglish / Bengali**	Write what went wrong in your own natural words (e.g. *'login button a click korle loader ghurteche kintu login hocche na'* or *'phone number 10 digit er kom dileo save hoy'*).
Step 4	**1-Click AI Translation**	Click the blue button: ■ **Convert to Professional QA English & Add to Excel**. In 2-3 seconds, screenshots upload to cloud, text is converted, and the row is saved to Excel.
Step 5	**Inspect & Manage**	View the new defect in the live table below. Click on ■ **Open bug_report.xlsx** to view and edit directly in Microsoft Excel.

4. AI Model & API Key Configuration (Recommended)

While the system includes a built-in Smart Semantic NLP engine that functions 100% offline, connecting a free Google Gemini API key enables **Computer Vision** to inspect your screenshots directly.

How to enable Gemini 2.5 Pro Vision AI:

1. Click the top navbar button: **AI Model & API Key**.
2. Click the link to get a 100% Free Gemini API key from Google AI Studio (takes 10 seconds).
3. Paste your key (starts with AIzaSy...) into the input box.
4. Select ■ **Gemini 2.5 Pro (Recommended - Deepest SQA Reasoning)** from the model dropdown.
5. Click ■ **Test Connection** to verify with Google servers.
6. Click ■ **Save Settings**. The status badge will glow green (■ AI Active: Gemini 2.5 Pro).

5. Spreadsheet & Table Management Tools

The live spreadsheet dashboard below the entry card mirrors your master bug_report.xlsx file in real time:

5.1 Opening Microsoft Excel Directly

Click the green ■ **Open bug_report.xlsx** button in the top navbar. Windows will immediately launch Microsoft Excel displaying your master file with full formatting, freeze panes, borders, and color coding.

5.2 Viewing Cloud Screenshots

In the **Screenshort** column, click on any ■ **View SS** link. It opens the high-resolution screenshot in a new browser tab. Anyone in your team can view the evidence without needing local access to your computer.

5.3 Deleting Columns (Customizing Your Report Format)

If your team does not need certain columns (e.g. *Dev Comment* or duplicate *Status*):

- **Single Column:** Click the small ✕ icon on any table column header.
- **Bulk Deletion:** Click the ■■ **Select & Delete Columns** button above the table. Select checkboxes for all columns you want to remove and confirm. The system permanently deletes them from bug_report.xlsx without shifting remaining indices.

5.4 Deleting Rows

Click the red trash icon (■■) on the right side of any row. The row is removed from Excel, and the automated **Sheet Compaction Engine** eliminates blank lines, ensuring remaining rows stay tight and sequential.

5.5 Real-Time Search Filter

Type any keyword into the ■ **Search bugs...** input box above the table. The table instantly filters matching defects by TID, Module, Title, or QA observation without reloading.

6. Before & After Transformation Examples

See how the system transforms informal Banglish inputs into enterprise-grade corporate English SQA reports:

Informal Input (Banglish)	Generated SQA Output (Corporate English)
'login button a click korle loader ghurteche kintu login hocche na'	**Module:** Authentication > User Login **Title:** Verify user authentication and dashboard redirect on login submission **Actual Result:** Upon clicking 'Log in', the button enters a continuous loading spinner state, authentication fails to complete, and the user is not redirected to dashboard. **QA Comment:** Infinite loading state on login submission. Likely unhandled promise rejection or CORS timeout.
'applicant portal a submitted application 1 ta thakleo dash a zero dekay'	**Module:** Applicant Portal > Dashboard **Title:** Verify that Applicant Dashboard reflects total submitted application count **Actual Result:** The Dashboard counter displays 0 applications despite an active submitted application existing under the applicant account. **QA Comment:** Data aggregation failure. Dashboard metrics endpoint returns 0 or fails to query applicant submission records.

'phone number 10 digit er kom dileo submit hoye jacche kono validation error nai'	**Module:** User Registration & Form Validation **Title:** Verify field length and format validation during form submission **Actual Result:** The system accepts invalid or short input without displaying any validation error, permitting corrupted data submission. **QA Comment:** Missing regex or minimum length validation constraint on client-side and server-side handlers.

7. Frequently Asked Questions & Troubleshooting

Q: I got an error saying 'bug_report.xlsx is currently open in Microsoft Excel'. What should I do?

A: Simply close the Excel window on your computer and click the button again. Windows locks open spreadsheets, but our system catches this safely so no data is lost.

Q: Can I use this application without an internet connection?

A: Yes! The built-in Smart Semantic NLP engine converts Banglish into professional English 100% locally. Screenshot cloud uploading will save locally when offline.

Q: Where are my screenshots stored?

A: Screenshots are hosted on high-availability cloud servers with direct HTTPS links accessible by developers, project managers, and clients anytime.
